

PEDRO EVALDT

Software Engineering Student | Backend Developer | DevOps Enthusiast

Porto Alegre, RS — Brazil

github.com/PedroEvaldt | linkedin.com/in/pedro-evaldt

SUMMARY

Software Engineering student at UFRGS with hands-on experience building full-stack projects in Go, Python, and C/C++. Passionate about backend development, DevOps practices, and data-driven solutions. Strong foundation in algorithms, data structures, and system design, with a growing focus on cloud infrastructure, containerization, and CI/CD pipelines. Self-motivated learner who thrives on turning complex problems into clean, efficient software.

EDUCATION

Bachelor of Software Engineering

Universidade Federal do Rio Grande do Sul (UFRGS) — Porto Alegre, RS, Brazil

Currently enrolled

- Relevant coursework: Algorithms & Data Structures, Operating Systems, Database Systems, Software Engineering, Computer Architecture
- Hands-on projects in backend development, data pipelines, and system-level programming

TECHNICAL SKILLS

Languages	Go, Python, C, C++, SQL, Bash
Backend & APIs	REST APIs, HTTP servers, Data Pipelines, Streamlit
DevOps & Cloud	Docker, Kubernetes, AWS, CI/CD Pipelines, Linux (Arch)
Data & Databases	PostgreSQL, pandas, Data Analysis, YAML/JSON
Tools & Platforms	Git, GitHub, Raspberry Pi, VS Code

PROJECTS

recall — Self-Hosted Note Management Server

Go | REST API | Raspberry Pi | Self-Hosted github.com/PedroEvaldt/recall

- Built a terminal-based personal knowledge management system as a Go HTTP server deployed on Raspberry Pi
- Implemented full CRUD operations for storing, searching, and retrieving personal notes and summaries
- Designed for self-hosting, emphasizing privacy, low-resource deployment, and CLI-first workflow

Finance Tracker — Personal Finance Data Pipeline & Dashboard

Python | pandas | Streamlit | YAML | pytest github.com/PedroEvaldt/Finance-tracker

- Developed an end-to-end data pipeline that ingests Nubank CSV bank exports, cleans and normalizes transaction data using pandas
- Implemented rule-based expense categorization engine with configurable YAML rules and manual override support
- Built an interactive Streamlit dashboard with filtering, charts (spending by category, monthly trends), and inline category editing
- Structured project with modular architecture (ingestion, cleaning, enrichment, categorization, analysis, export) and automated tests

Banking System Simulator — OOP Banking Application

C++ | Object-Oriented Programming github.com/PedroEvaldt/banking_cpp

- Designed and implemented a banking system simulation applying OOP principles (encapsulation, inheritance, polymorphism)
- Managed account operations, transactions, and data persistence in C++

Git Simulator — Version Control Internals

Python | *Data Structures* | *CLI* github.com/PedroEvaldt/Git-Simulator

- Recreated core Git operations (commit, branch, merge, log) from scratch to understand version control internals
- Applied tree-based data structures and hashing concepts for commit tracking and history management

Webmail Organizer — Email Automation Tool

Go | *Email Protocols* | *Automation* github.com/PedroEvaldt/webmail_organizer

- Built a Go-based tool for automated email organization and management
- Implemented email protocol integration for sorting, filtering, and categorizing messages programmatically

ADDITIONAL INFORMATION

- **Languages:** Portuguese (native), English (professional proficiency)
- **Interests:** Machine Learning, Data Analysis, Backend Architecture, Open Source, Self-Hosting, Linux System Administration
- **Environment:** Daily Arch Linux user with deep experience in system configuration, troubleshooting, and command-line workflows
